### Stability theory Q-vector spaces and algebraically closed fields

Can we characterise which  $\mathbb{Q}\text{-vector}$  spaces there are (up to isomorphism)?

Yes, easy,  $\mathbb{Q}\text{-vector spaces are determined (up to isomorphism) by their dimension.$ 

That is, a well-defined cardinal dim(V) can be assigned to each  $\mathbb{Q}$ -vector space V and there is exactly one  $\mathbb{Q}$ -vector space with dimension  $\kappa$  for each cardinal  $\kappa$ .

### Stability theory Q-vector spaces and algebraically closed fields

Can we characterise which  $\mathbb Q\text{-vector}$  spaces there are (up to isomorphism)?

Yes, easy,  $\mathbb{Q}\text{-vector spaces are determined (up to isomorphism) by their dimension.$ 

That is, a well-defined cardinal dim(V) can be assigned to each  $\mathbb{Q}$ -vector space V and there is exactly one  $\mathbb{Q}$ -vector space with dimension  $\kappa$  for each cardinal  $\kappa$ .

Similarly, algebraically closed fields (of a fixed characteristic) are determined by their transcendence degree.

# Stability theory

Morley (1965): if a (countable) theory has exactly one model of some uncountable cardinality then it has exactly one model of every uncountable cardinality.

# Stability theory

Morley (1965): if a (countable) theory has exactly one model of some uncountable cardinality then it has exactly one model of every uncountable cardinality.

This applies to our examples of  $\mathbb{Q}\text{-vector}$  spaces and algebraically closed fields.

# Stability theory

Morley (1965): if a (countable) theory has exactly one model of some uncountable cardinality then it has exactly one model of every uncountable cardinality.

This applies to our examples of  $\mathbb{Q}\text{-vector}$  spaces and algebraically closed fields.

This sparked a great amount of research with as a result Shelah's celebrated *stability theory* (1970).

# Write $I(T, \kappa)$ for the number of models of a theory T of cardinality $\kappa$ .

▲ロ ▶ ▲周 ▶ ▲ 国 ▶ ▲ 国 ▶ ● の Q @

# Write $I(T, \kappa)$ for the number of models of a theory T of cardinality $\kappa$ .

```
What is I(T, \kappa) for each \kappa?
```

Write  $I(T, \kappa)$  for the number of models of a theory T of cardinality  $\kappa$ .

```
What is I(T, \kappa) for each \kappa?
```

So Morley's theorem says that if  $I(T, \kappa) = 1$  for some uncountable  $\kappa$  then  $I(T, \kappa) = 1$  for all uncountable  $\kappa$  (T countable).

Write  $I(T, \kappa)$  for the number of models of a theory T of cardinality  $\kappa$ .

What is  $I(T, \kappa)$  for each  $\kappa$ ?

So Morley's theorem says that if  $I(T, \kappa) = 1$  for some uncountable  $\kappa$  then  $I(T, \kappa) = 1$  for all uncountable  $\kappa$  (T countable).

#### Theorem (Main Gap Theorem, Shelah (1982))

Let T be a countable theory. Either  $I(T, \aleph_{\alpha}) = 2^{\aleph_{\alpha}}$  for all  $\alpha \ge 1$  (i.e. it is maximal) or

$$I(T, \aleph_{\alpha}) < \beth_{\omega_1}(|\alpha|)$$

for all  $\alpha \geq 1$ .

To define a good notion of dimension, we will need a notion of independence (think back to linear independence and algebraic independence).

▲□▶ ▲□▶ ▲三▶ ▲三▶ 三三 のへで

## Stability theory

To define a good notion of dimension, we will need a notion of independence (think back to linear independence and algebraic independence).

A key idea in Shelah's work is *forking*, which yields an independence relation.

## Stability theory

To define a good notion of dimension, we will need a notion of independence (think back to linear independence and algebraic independence).

A key idea in Shelah's work is *forking*, which yields an independence relation.

Side note: it is actually the negation, so non-forking, that gives us independence. So forking actually expresses that things are dependent.

## Stability theory

To define a good notion of dimension, we will need a notion of independence (think back to linear independence and algebraic independence).

A key idea in Shelah's work is *forking*, which yields an independence relation.

Side note: it is actually the negation, so non-forking, that gives us independence. So forking actually expresses that things are dependent.

Linear independence in vector spaces coincides with non-forking. Same for algebraic independence in algebraically closed fields.

## Stability theory

To define a good notion of dimension, we will need a notion of independence (think back to linear independence and algebraic independence).

A key idea in Shelah's work is *forking*, which yields an independence relation.

Side note: it is actually the negation, so non-forking, that gives us independence. So forking actually expresses that things are dependent.

Linear independence in vector spaces coincides with non-forking. Same for algebraic independence in algebraically closed fields.

Shelah pinned down a class of theories where forking is very well-behaved, the *stable* theories.

Source: https://forkinganddividing.com

▲ロ ▶ ▲周 ▶ ▲ 国 ▶ ▲ 国 ▶ ● の Q @

In NSOP<sub>1</sub> theories forking is no longer so well-behaved, yet many  $NSOP_1$  theories with a good notion of independence were known.

▲□▶ ▲□▶ ▲□▶ ▲□▶ □ のQで

In NSOP<sub>1</sub> theories forking is no longer so well-behaved, yet many NSOP<sub>1</sub> theories with a good notion of independence were known.

▲□▶ ▲□▶ ▲□▶ ▲□▶ □ のQで

Kaplan and Ramsey, inspired by ideas from Kim, developed a notion called *Kim-forking*, which is well-behaved in NSOP<sub>1</sub> theories (2017).

In NSOP<sub>1</sub> theories forking is no longer so well-behaved, yet many NSOP<sub>1</sub> theories with a good notion of independence were known.

Kaplan and Ramsey, inspired by ideas from Kim, developed a notion called *Kim-forking*, which is well-behaved in NSOP<sub>1</sub> theories (2017).

The 'good' case of Shelah's main gap theorem takes place in the stable class (even superstable). However, the tools developed for it are still useful in the simple and  $NSOP_1$  classes. So it is interesting to know where a theory lives in this picture.

# Lifting independence Lifting uniqueness (attempt)

#### Proposition

If  $F : C \to D$  is a left multiadjoint and  $\bigcup$  is an independence relation on D that satisfies uniqueness then  $F^{-1}(\bigcup)$  satisfies uniqueness.

# Lifting independence Lifting uniqueness (attempt)

#### Proposition

If  $F : C \to D$  is a left multiadjoint and  $\bigcup$  is an independence relation on D that satisfies uniqueness then  $F^{-1}(\bigcup)$  satisfies uniqueness.

Left (multi)adjoints that look like forgetful functors are rare, definitely between AECats.

Often left (multi)adjoints are functors between bigger categories.

For example the forgetful  $\mathbf{Ab}^M \to \mathbf{Ab}$ , where M is a monoid, is left adjoint.

Often left (multi)adjoints are functors between bigger categories.

For example the forgetful  $\mathbf{Ab}^M \to \mathbf{Ab}$ , where M is a monoid, is left adjoint.

Meanwhile,  $\mathbf{Ab}_{mono}$  carries a stable independence relation given by pullback squares.

The forgetful  $Ab^M \rightarrow Ab$  restricts to  $Ab^M_{mono} \rightarrow Ab_{mono}$ , and the latter lifts uniqueness, as is seen by temporarily working in the bigger categories.

## Lifting independence

#### Theorem

Let  $F : \mathcal{C} \to \mathcal{D}$  be a left multiadjoint and let  $\mathcal{M}$  be a left-cancellable composable class of arrows in  $\mathcal{D}$ . If  $\bigcup$  is an independence relation on  $\mathcal{D}_{\mathcal{M}}$  that satisfies uniqueness then the independence relation  $F^{-1}(\bigcup)$  on  $\mathcal{C}_{F^{-1}(\mathcal{M})}$  satisfies uniqueness.

## Lifting independence

#### Theorem

Let  $F : C \to D$  be a faithful left multiadjoint and let  $\mathcal{M}$  be a left-cancellable composable accessible and continuous class of monomorphisms in  $\mathcal{D}$ . Suppose that  $\bigcup$  is an independence relation on  $\mathcal{D}_{\mathcal{M}}$ , that satisfies semi-invariance as an independence relation on  $\mathcal{D}$ .

- If  $\ \$ is stable then  $F^{-1}(\ \ )$  is stable.
- If ⊥ is simple, C<sub>F<sup>-1</sup>(M)</sub> and D<sub>M</sub> have binary joins of subobjects and F preserves those then then F<sup>-1</sup>(⊥) is simple.
- If  $\ \ is \ NSOP_1$ -like then  $F^{-1}(\ \ )$  is  $NSOP_1$ -like.

- If ⊥ is simple, C<sub>F<sup>-1</sup>(M)</sub> and D<sub>M</sub> have binary joins of subobjects and F preserves those then then F<sup>-1</sup>(⊥) is simple.
- If  $\ \ is \ NSOP_1$ -like then  $F^{-1}(\ \ )$  is  $NSOP_1$ -like.

There is a second flavour of conditions on F in our preprint (Kamsma and Rosický [2024]) that gives a similar conclusion.
